

SUBJECT: MATH

TOPIC: Algebraic Expression

CLASS:

Solve the following algebra expression

1. $\frac{2x}{4} + \frac{2x}{5}$

$$\frac{(\quad) + (\quad)}{\quad}$$
$$= \frac{\quad}{\quad}$$

2. $\frac{t}{2} + \frac{t}{3}$

$$\frac{(\quad) + (\quad)}{\quad}$$
$$= \frac{\quad}{\quad}$$

3. $\frac{2w}{9} + \frac{4w}{11}$

$$\frac{(\quad) + (\quad)}{\quad}$$
$$= \frac{\quad}{\quad}$$

4. $\frac{b}{3} + \frac{3b}{5}$

$$\frac{(\quad) + (\quad)}{\quad}$$
$$= \frac{\quad}{\quad}$$

5. $\frac{3m}{2} - \frac{5m}{7}$

$$\frac{(\quad) - (\quad)}{\quad}$$
$$= \frac{\quad}{\quad}$$

6. $\frac{4d}{5} - \frac{d}{6}$

$$\frac{(\quad) - (\quad)}{\quad}$$
$$= \frac{\quad}{\quad}$$

7. $\frac{3x}{10} - \frac{x}{5}$

$$\frac{(\quad) - (\quad)}{\quad}$$
$$= \frac{\quad}{\quad}$$

8. $\frac{3v}{7} - \frac{2v+3}{3}$

$$\frac{(\quad) - (\quad)}{\quad}$$
$$\frac{\quad - \quad - \quad}{\quad}$$
$$= \frac{\quad}{\quad}$$
