We're in London at St Thomas' hospital for a very special <sup>1</sup>\_\_\_\_\_ of twins. Scientists love identical twins because they're perfect for examining how nature and <sup>2</sup>\_\_\_\_\_ affect our lives. By studying both the similarities and differences <sup>3</sup>\_\_\_\_\_ identical twins, scientists can begin to answer the big question – are we <sup>4</sup>\_\_\_\_\_ , or are we made the way we are? If twins have grown up in the same <sup>5</sup>\_\_\_\_\_ , it's difficult to know whether it's genes or experiences that have made them similar. It would be easier to check if they'd had different lives. Cases of twins growing up apart are <sup>6</sup>\_\_\_\_\_ , but they do exist.
