

PRE READING: A SNAKE

Written by Mr. Soebekti

Read the text before doing the activities!

Snakes are reptiles (cold-blooded creatures). They belong to the same group as lizards (the scaled group, Squamata) but from a sub-group of their own (Serpentes).

Snakes have no legs but a long time ago they had claws to help them slither along. Snakes are not slimy. They are covered in scales which are just bumps on the skin. Their skin is hard and glossy to reduce friction as the snake slithers along the ground.

Snakes often sun bathe on rocks in the warm weather. This is because snakes are cold-blooded; they need the sun's warmth to heat their bodies up.

Most snakes live in the country. Some types of snakes live in trees, some live in water, but most live on the ground in deserted rabbit burrows, in thick, long grass and in old logs.

A snake's diet usually consists of frogs, lizards, and mice and other snakes. The Anaconda can eat small crocodiles and even bears. Many snakes protect themselves with their fangs. Some snakes are protected by scaring their enemies away like the Cobra. The flying snakes glide away from danger. Their ribs spread apart and the skin stretches out. Its technique is just like the sugar gliders.

Select the correct answer!

What does a snake belong to? A kind of mammals Reptiles Fish cat

How does a snake walk to other places? Slither along With their legs With their claws

Why does a snake often sunbathe? To seek food To protect from their enemies.
 To warm their bodies.

Where does a snake live? In a big cave In old logs In an old hut.

How does the cobra protect from the enemy? By scaring By flying By hitting.

Match the statement on the right by drawing a line to the suitable paragraph!
