Experts say that by 2030, the world's population [1] *will be increasing / will have increased* to 8.5 billion. These extra people [2] *will have used / will be using* a lot more energy, so we'll need to find new energy sources. Solar power is one possible solution, and countries in Africa may have a big role to play in this. For example, Morocco has recently built a huge solar power plant in the Sahara desert, which [3] *will be starting / will have started* to produce a third of the country's energy within five years. By 2030, the government hopes that it [4] *will be producing / will have produced* 52% of its energy from solar power. They also hope that one day Morocco [5] *will have become / will be becoming* energy-independent and that they [6] *will be selling / will have sold* energy to other countries around the world. If everything goes to plan, some day in the future, a person living in Europe [7] *will have used / will be using* electricity produced in Africa.
