

Pages 64-67.

1. There are aquatic and terrestrial ecosystems on Earth. Read and complete.

The factors that affect aquatic ecosystems the most are sunlight, temperature and salt.

The factors that affect terrestrial ecosystems the most are temperature, humidity, relief and soil.

Factors that affect \_\_\_\_\_ ecosystems:

- \_\_\_\_\_ decreases as the depth increases.
- \_\_\_\_\_ determines the organisms that can live in the ecosystem.
- Aquatic ecosystems are freshwater or saltwater, depending on the amount of \_\_\_\_\_.

Factors that affect \_\_\_\_\_ ecosystems:

- \_\_\_\_\_ is highest at the Equator and it falls as we move towards the poles.
- \_\_\_\_\_ mainly depends on the amount of rain in an area.
- \_\_\_\_\_ is the shape of the land. The land can be flat or steep.
- Some \_\_\_\_\_ are deeper and more fertile than others.

2. Aquatic ecosystems cover a lot of the Earth's surface. Look at the diagram and name the type of aquatic ecosystem in each photo.
