

NUCLEUS (PLURAL: NUCLEI)

Characteristics

- Largest component in the cell
- Spherical, compressed and enclosed in a nuclear membrane with many pores
- The nucleus contains chromosomes, nucleolus and nucleoplasm.

Function:

- Controls all cell activities
- Has chromosomes that contain deoxyribonucleic acid (DNA). DNA determines the cell characteristics and metabolic function

What happens if the nucleus is damaged? (3 marks)

RIBOSOME

Characteristics

- Small, compact and spherical granules
- Consists of protein and ribonucleic acid (RNA)
- Ribosomes are present on the surface of the rough endoplasmic reticulum or exist freely in the cytoplasm.

Function

Site for protein synthesis

Questions

- What happens if ribosomes are removed? (3 marks)
- What are the two types of ribosomes? (2 marks)
