Expressing Decimals as Fractions in their Lowest Terms.

- Remove the decimal point and write the number as a numerator.

- The denominator will be a multiple of 10 based on the last digit in the decimal number.

- Reduce fraction to lowest terms.

  Examples: $0.12 = \dfrac{12}{100} = \dfrac{3}{25}$ $2.45 = 2\dfrac{45}{100} = 2\dfrac{9}{20}$

Now try these!

- $0.6 =$

- $0.7 =$

- $0.10 =$

- $0.07 =$

- $0.20 =$

- $0.25 =$

- $0.40 =$

- 0.70 =

- 1.75 =

- 4.90 =

- 2.80 =

- 7.05 =

- 8.15 =

- 6.32 =
