<b>ONLINE TEST (LIVE WORKSHEET)</b>		<b>TIME: 15 MINUTES.</b>
<b>AUDIO TRACK – 13 (CLICK HERE) →</b>		

**Listen to the audio and response to the questions.**

**I. Choose the best one.**

- Where does the Giant Pangolin live?
- What feature helps the Giant Pangolin find food at night?
- How does the Giant Pangolin primarily move around?
- What does the Giant Pangolin use its long tongue for?

**II. Whether the statements are true or false.**

- The Giant Pangolin sleeps during the night.
- The Giant Pangolin has very long, sharp claws on its front legs.
- The Giant Pangolin uses its teeth to chew food.
- The Giant Pangolin can hear very well despite not having visible ears.

**III. Drag and drop the correct response.**

sense of hearing
long tongue
pointed nose

rainforests
nocturnal

The Giant Pangolin is a unique mammal that lives in the \_\_\_\_\_ and savannahs of Africa. It is primarily \_\_\_\_\_, which means it is active during the night and sleeps during the day. This animal has a small head and a long \_\_\_\_\_, which helps it sniff out ants and termites, its favorite food. Instead of using teeth to chew, the Giant Pangolin has a \_\_\_\_\_ that it uses to scoop up its food. Its body is covered in large brown scales, which provide protection from predators. Despite not having visible \_\_\_\_\_ ears, the Giant Pangolin has an excellent \_\_\_\_\_.
