

Fill in the gap with ONLY ONE WORD

Studying at university is an important stage in every person's life. Some undergraduates prefer focusing on subjects related to their future careers, while others try to get a well-rounded education by (1) their schedules with disciplines outside their specialisation. In my opinion, broadening horizons is necessary for students; otherwise, they risk acquiring narrow knowledge that may limit their potential.

There might be several reasons why some young people tend to focus solely on subjects related to their chosen qualification. Firstly, every academic program consists of various courses that demand a lot of time, mental and physical (2) to complete. It is an entire field that gradually reveals its treasures, providing undergraduates with all the necessary skills. By focusing on one selected sphere, they may gain more in-depth knowledge that will become a good basis for future professional development. Secondly, (3) curricula are carefully designed by educators; therefore, it is not necessary to artificially broaden them. For example, medical school curricula cover all necessary aspects of medical science, ensuring students gain comprehensive knowledge and (4) skills. Adding unrelated subjects could overwhelm students and detract from their focus on mastering core medical subjects.

However, I agree with those who prefer a multidisciplinary approach to studying. First of all, being too focused on one area of study may kill students' curiosity, limit their potential, and lead to the acquisition of very narrow knowledge. Moreover, taking into account that (5) academic skills are always valued by employers, a multidisciplinary approach can significantly improve (6) after graduation. For instance, graduates with both business management and computer science knowledge are often preferred by tech companies for their ability to understand technical aspects and lead projects.

In conclusion, while people's opinions differ as to whether or not a (7) approach may be beneficial to students, I strongly believe that a versatile education plays a pivotal role in the professional and personal development of young people and is a key factor that improves their career prospects.
