

미니테스트 2회- 5번.
(지능을 갖춘 기계에 대한 우려)

As information devices	does not mean	implacable villains
the most useful technologies	manipulate people	destroy property
malevolent	threaten	concern
tools	for	nuclear bombs
nuclear arsenal		

Beyond self-replication and the copying of minds, people have another 우려 with intelligent machines. Might intelligent machines somehow 위협하다 large portions of the population, as 핵 폭탄 do? Might their presence lead to the superempowerment of small groups or 악의적인 individuals? Or might the machines become evil and work against us, like the 무자비한 악당들 in *The Terminator or the Matrix movies*? The answer to these questions is no. 정보 장치로써, brainlike memory systems are going to be among 가장 유용한 기술 we have yet developed. But like cars and computers, they will only be 도구들. Just because they are going to be intelligent 의미하지 않는다 they will have special abilities to 재산을 파괴하다 or 사람들을 조종하다. And just as we wouldn't put the control of the world's 핵 무기 under the authority of one person or one computer, we will have to be careful not to rely too much on intelligent machines, 왜냐하면 they will fail as all technology does.
