Start here

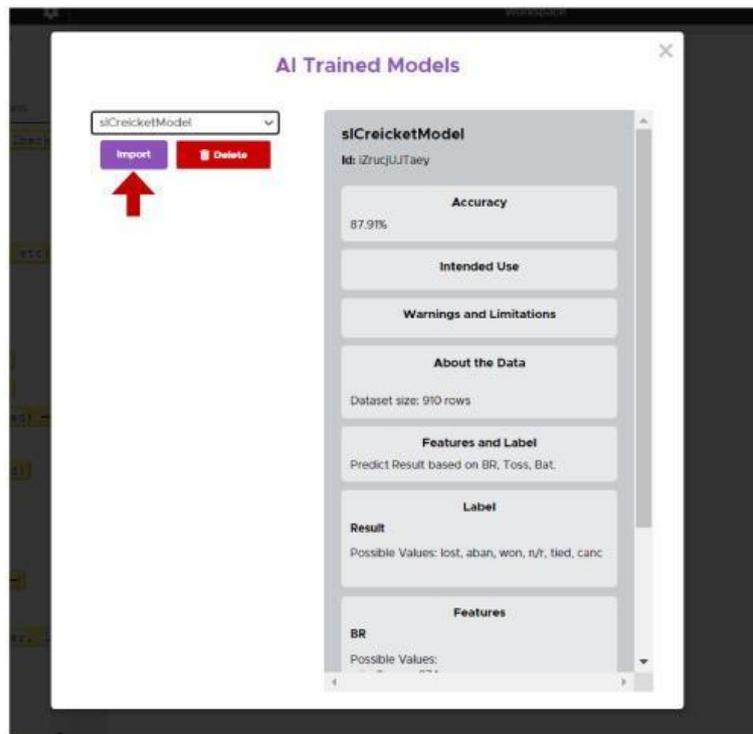

- ❖ Here, using the machine learning modal we created in homework 167, let's create a mobile app to predict whether the Sri Lankan cricket team will win or lose a match by the app lab.
- ❖ Let's create the mobile app as follows.

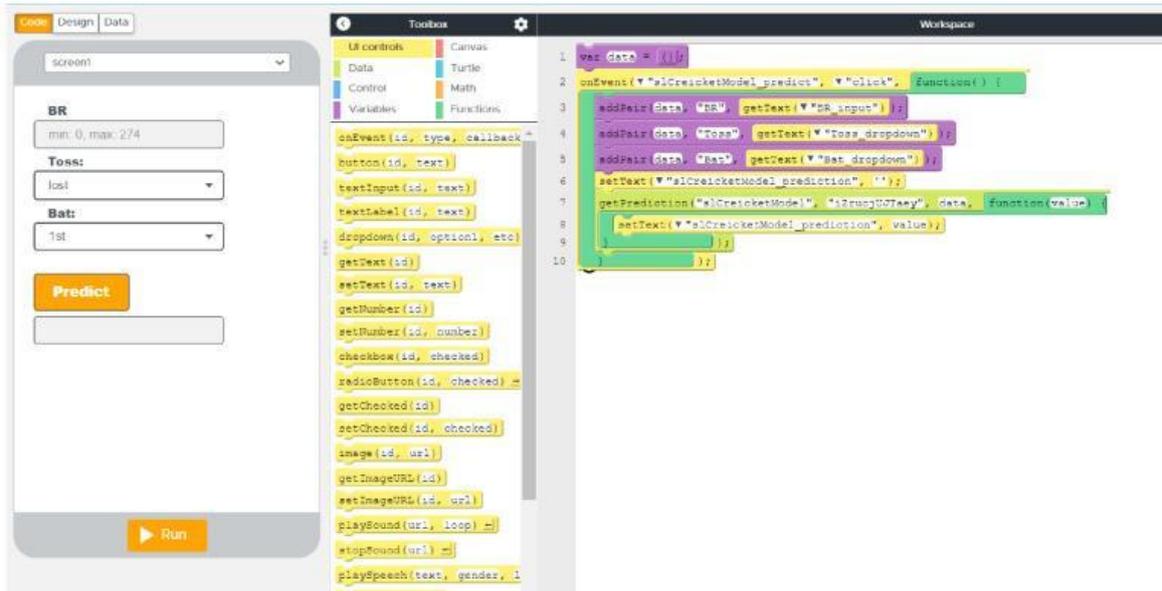

- ❖ First, import the "slCreicketModel" model you created for the app lab.
- ❖ Click on the setting button in the Toolbox and click on Manage AI models.

- ❖ Now select the “sICricketModel” model and click on the import button.

- ❖ Then the model is imported for the app lab as follows

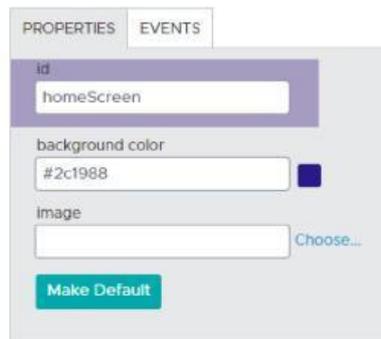

- ❖ Now let's add a home screen for this app.
- ❖ Click on Design for that.

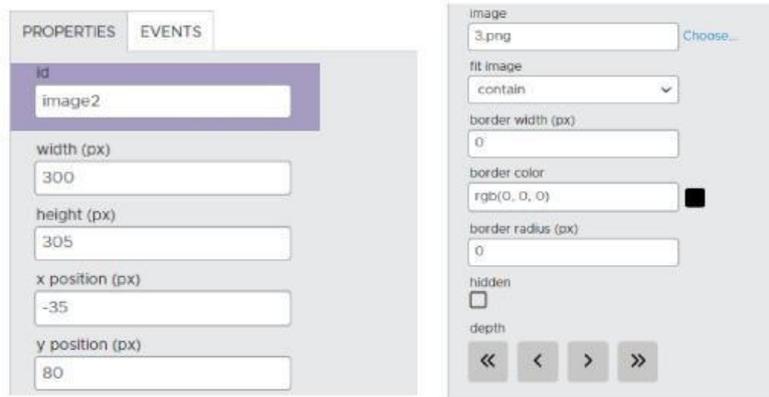

- ❖ Click on the dropdown below and add a new screen.

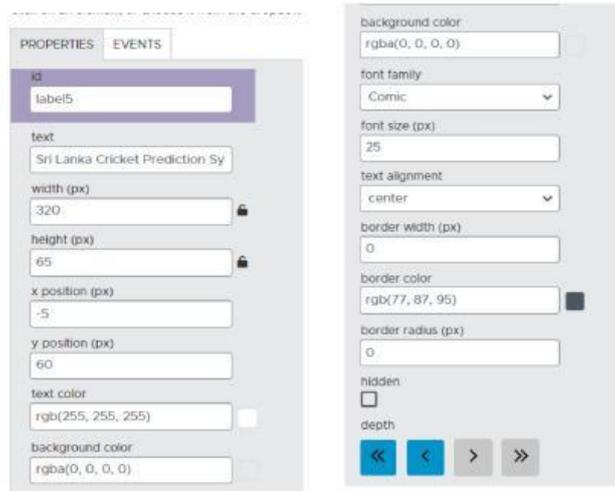

- ❖ Set the id of that screen as "homeScreen" and the following background color and make that screen the default screen. For that, click on the Make Default button.

- ❖ Now add an image tag for the homescreen.
- ❖ Click on Choose and add a suitable image for the home screen.
- ❖ Here we have selected image2 and set its properties as follows.

- ❖ Now add a label for that screen and adjust its properties as follows.
- ❖ Give as “Sri Lanka Cricket Prediction System” for Text.

- ❖ Now provide the button for that screen. Give its id as stratBtn and text as start.

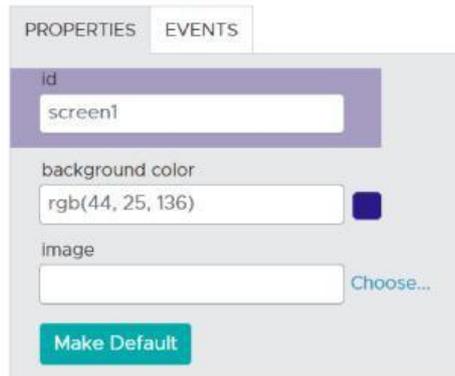

- ❖ Then the home screen will be created as follows.

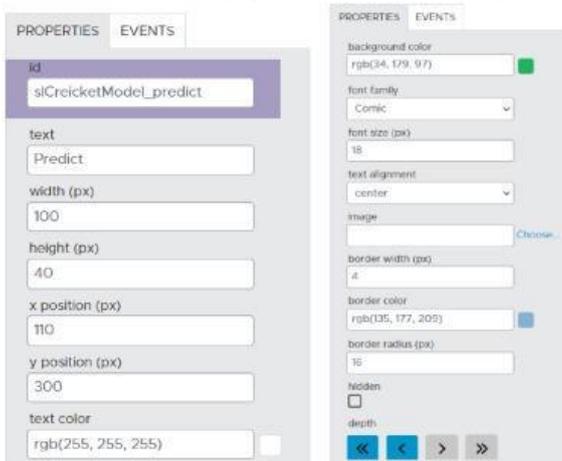

- ❖ Now let's set it to go to screen1 when the start button is clicked.

```
onEvent (▼ "stratBtn", ▼ "click", function() {
  setScreen (▼ "screen1");
});
```

- ❖ Now let's design screen1.

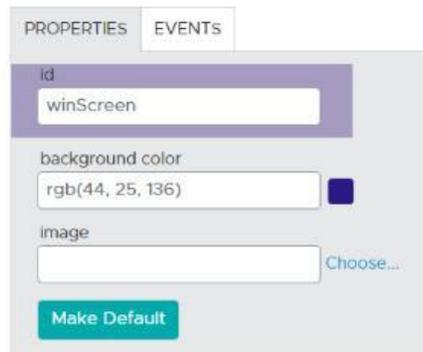

- ❖ Give the x and y position for the labels and inputs in Screen1 as follows.

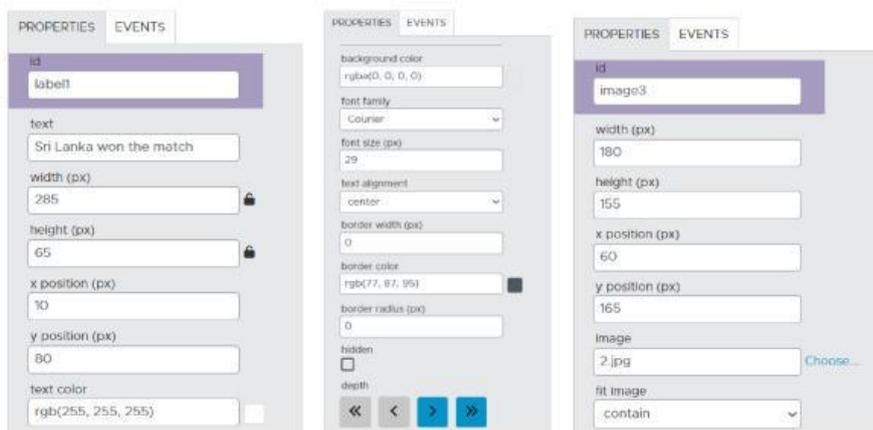

- ❖ Give the properties for the button as follows.

- ❖ Now add another screen and give its id and background color as below.

- ❖ Add a label and image for that screen and give the properties as below.

- ❖ Now duplicate the winScreen.
- ❖ Give the id of that screen as loseScreen.
- ❖ Now give the label of loseScreen as Sri Lanka Lose the match.
- ❖ Change the image on that screen as well.
- ❖ Now when the predict button on screen 1 is clicked, let's make it move to the match screen according to the result.

- ❖ Here, if the result is won, let's move to the winScreen, and if the result is lose, let's move to the loseScreen.

```
var data = {};  
onEvent(▼"slCreicketModel_predict", ▼"click", function() {  
  addPair(data, "BR", getText(▼"BR_input"));  
  addPair(data, "Toss", getText(▼"Toss_dropdown"));  
  addPair(data, "Bat", getText(▼"Bat_dropdown"));  
  getPrediction("slCreicketModel", "iZrucjUJTaey", data, function(value) {  
    if (value == 'won') {  
      setScreen(▼"winScreen");  
    }  
    else {  
      setScreen(▼"loseScreen");  
    }  
  });  
});
```
