

Station 1: Practice Problems

$$\begin{aligned}y &= 6x - 11 \\ -2x - 3y &= -7\end{aligned}$$

$$\begin{aligned}-3x + 3y &= 4 \\ -x + y &= 3\end{aligned}$$

$$\begin{aligned}y &= 5x - 7 \\ -3x - 2y &= -12\end{aligned}$$

$$\begin{aligned}x + 3y &= 1 \\ -3x - 3y &= -15\end{aligned}$$

Station 2: Word Problems

There are a total of 85 maple and walnut trees on a piece of land. There are 13 more maple trees than walnut trees. How many maple and walnut trees are on this piece of land?

Keegan bought 5 T-shirts and 2 pairs of shorts for \$49.50. Each pair of shorts, s , cost twice as much as each T-shirt, t .

A community center is hosting presentations of a puppet show. If the adult's ticket is for \$10, and the child's ticket is for \$5. For the Saturday matinee show, 480 tickets have been sold for total proceeds of \$305

Justin goes to a store to buy jeans and T-shirts. The jeans cost \$40 each and the T-shirts cost \$20 each. If Justin spends \$100 on 4 items, how many pairs of jeans and how many T-shirts did he buy?

Station 3: Error Analysis

Given the system:

$$y = 2x + 1, \quad 3x + y = 7$$

Incorrect solution:

$$3x + (2x + 1) = 7$$

$$3x + 2x + 1 = 7$$

$$5x = 7$$

Find the mistake and correct it.

$$5x + y = 8$$

$$2x + y = 5$$

Two students, Marc and Loise, used the elimination method to solve this system.

•**Marc's Solution:** He subtracted the equations to get $3x = 3$, found $x = 1$, and then $y = 3$.

•**Loise's Solution:** She Added the equations to get $7x + 2y = 13$ and found $x = 3$, $y = -1$. Who is correct, and what was the other student's mistake?

Find the mistake in the solution of

$$x = 2y + 1, \quad 3x + 2y = 11$$

Student's Work:

1. Substitute $x = 2y + 1$ into $3x + 2y = 11$
 $3(2y + 1) + 2y = 11$
2. Distribute $6y + 1 + 2y = 11$
3. Combine terms: $8y + 1 = 11$
4. Solve for y: $y = 11 - 1 \implies y = 10$
5. Substitute $x = 2(10) + 1 = 21$
