Activity 2.2.2

Categories and Algorithms of Machine learning

Statement	True / False
AI is a subset of machine learning.	
A computer that uses machine learning needs to take orders from the user.	
Machine learning uses datasets to learn from data.	
You can find the features and labels in the dataset by default.	
Features can be defined as the unique characteristics of something.	
The accuracy of a machine learning model determines the best relationships and patterns present in a dataset.
