

UNDERSTANDING THE MOLE AND AVOGADRO'S CONSTANT

A chemist and a physicist went shopping for Carbon-12. Help them complete their tasks as they need!

$$1 \text{ mol} = 6.02 \times 10^{23} \text{ particles} = 12 \text{ g of Carbon-12}$$

The store sells carbon-12 in different quantities according to the label on the shelf. Type in the needed amount on their baskets.

<p>I need 2 mol of carbon</p> 	<p>I need 30.1×10^{23} particles</p> 	<p>I need 12 g of carbon</p> 
<p>I need 36 g of carbon</p> 	<p>I need 1 mol of carbon</p> 	<p>I need 6.02×10^{23} particles</p>
