Order Block + Void indicator Download for MT4 - Free - [Trading Finder]

TradingView MetaTrader4 MetaTrader5

LIVEWORKSHEETS

Order Blocks are important zones where large buy and sell orders from major financial institutions are placed. Order blocks typically act as strong **support** and **resistance levels** on the chart.

The **Order Block + Void** indicator for **MetaTrader 4** automatically plots these order blocks on the price chart. One feature of this indicator displays the consumed portion of the order block as a percentage, with the consumed area turning gray.

This **MT4 liquidity indicator** draws **bullish order blocks** as green boxes and **bearish order blocks** as red boxes.

How Bullish Order Blocks Form and Work

The price chart of the **USD/CHF** pair in a one-hour timeframe shows how a bullish order block functions. According to the chart, the indicator first identifies the order placement area and then plots a bullish order block in green. The price return to the bullish order block provides a good entry point for **buy** trades.

The **gray** area in the bearish order block shows the consumed portion of that block.

How Bearish Order Blocks Form and Work

In bearish conditions, as seen in the **ETH** price chart in a 30-minute timeframe, the indicator identifies the order placement zone and plots a bearish order block in red. The price return to the order block can be a suitable entry point for **sell** trades. Whenever an order block, as shown in the image, is fully consumed, it changes color to gray and becomes invalid.
