

CHECK THE targets

Elizabeth Red

I'd like you to check my electrical device.
It is not cold, and sometimes it makes a loud hissing sound. I just had it filled with gas last month.

Every morning when I
turn it on to iron my clothes,
I notice a strange burning smell
coming from the back.
After a few minutes,
it suddenly shuts off. I tried unplugging
and plugging it in again—it works
for a while, but then it stops again.
Now I'm afraid to use it because
I don't want to cause a fire.

Kevin Ross

Chris Smith

I want to heat my food. So, I pressed the power button, but nothing happened. The screen didn't light up at all. I've checked the plug. It's firmly connected. I even tried another outlet, but still no response. Two days ago, it was flickering on and off. Now it just won't turn on. I use it every day, and I'm really frustrated.

It works normally at first, but after a few minutes, the spinning speed starts to drop. The sound changes too, like the motor is struggling. I tried adding some oil to help it spin, but it didn't really fix it. Also, it gets really hot quickly, and I'm worried it might overheat

Susan Jell

Idan William

Every time I plug it in, the lights in my house flicker or go out. Sometimes it even trips the circuit breaker. It only takes about 10 minutes of use before everything goes dark again. I think it's using too much electricity or maybe there's a short circuit inside. I want to take a shower happily.
