

Paragraph 1

Robots are now used in many areas of life, including education. In several countries like Japan, South Korea, and China, robots are already working in classrooms. These robots help teachers, support students, and sometimes even lead simple lessons. For example, in South Korea, a robot called Engkey has been used to teach English in elementary schools. This robot is connected to a native speaker who teaches from another location, giving students a chance to practice speaking English every day.
