

IT'S TIME FOR READING!

The rainforest is one of the most important ecosystems on Earth. It is home to over half of the world's plant and animal species. Rainforests play a key role in producing oxygen, regulating the climate, and providing resources such as food and medicine. However, they are also in danger because of deforestation, which destroys habitats and threatens biodiversity. Protecting rainforests is essential not only for wildlife but also for the health of our planet and future generations.

DID YOU GUESS...

1. What percentage of plant and animal species live in the rainforest?

- 10%
- 25%
- 50%
- Over 50%

DID YOU GUESS...

2. Which of the following is NOT a benefit of rainforests?

- Producing oxygen
- Regulating climate
- Providing food and medicine
- Producing fossil fuels

DID YOU GUESS...

3. What is the main threat to rainforests mentioned in the text?

- Pollution
- Deforestation
- Volcanoes
- Tourism

DID YOU GUESS...

4. Why is protecting the rainforest important?

- For biodiversity and global health
- Only to stop tourism
- To increase fossil fuel production
- To build more cities

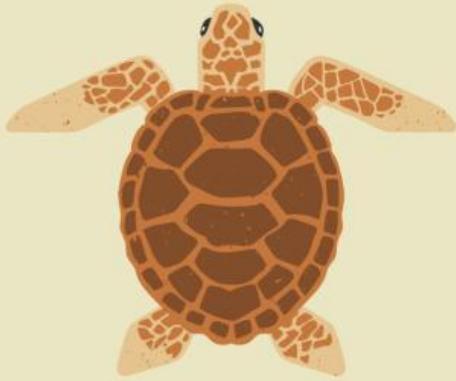

Rainforests are home to fewer than 25% of the world's species

FALSE

TRUE

Deforestation is a danger to biodiversity.

FALSE

TRUE

Rainforests help regulate the Earth's climate.

FALSE

TRUE

MATCH COLUMN A WITH COLUMN B:

A

Rainforests produce

Deforestation causes

Protecting rainforests
helps

B

Loss of habitats

Future generations

Oxygen and
resources
