Today we're going to look at an important area of science(1).....nanotechnology. So what is it? Nano means tiny, so it's science and engineering on the scale of atoms and molecules. The idea is that by controlling and (2)..... atoms, you can literally create anything. However, as we'll see, the science of the small has some big implications affecting us in many ways.

There's no doubt that nanotechnology promises so much for (3)..... However, all new technologies have their teething problems. And with nanotechnology, society often gets the wrong idea about its capabilities. (4)..... science-fiction books and movies have raised people's fears about nanotechnology – with scenarios such as inserting little nano-robots into your body that (5)..... everything you do without you realising it, or self-replicating nano-robots that eventually take over the world.

So how do we safeguard such a potentially powerful technology? Some scientists recommend that nano-particles be treated as new (6)..... with separate safety tests and clear labelling. They believe that greater care should also be taken with nano-particles in laboratories and factories. Others have called for a (7)..... of new nano products such as (8)..... and a temporary halt to many kinds of nanotech research.

But as far as I'm concerned there's a need to plough ahead with the discoveries and applications of nanotechnology. I really believe that most scientists would welcome a way to guard against unethical uses of such technology. We can't go around thinking that all innovation is bad, all (9)..... is bad. As with the debate about any new technology, it is how you use it that's important. So let's look at some of its possible uses.

Thanks to nanotechnology, there could be a major (10)..... in the field of transportation with the production of more durable metals. These could be virtually unbreakable, lighter and much more pliable leading to planes that are 50 times lighter than at present. Those same improved capabilities will dramatically reduce the cost of travelling into space making it more (11)..... to ordinary people and opening up to totally new holiday destination.

In terms of technology, the computer industry will be able to (12)..... computer parts down to minute sizes. We need nanotechnology in order to create a new (13)..... of computers that will work even faster and will have a million times more memory but will be about the size of a sugar cube. Nanotechnology could also revolutionise the way that we (14)..... power. The cost of solar cells will be drastically reduced so (15)..... this energy will be far more (16)..... than at present.

But nanotechnology has much wider applications than this and could have an enormous impact on our environment. For instance, tiny airborne nano-robots could be programmed to actually (17)..... the ozone layer, which could (18) the impact of global warming on our planet. That's a pretty amazing thought, isn't it? On a more local scale, this new technology could help with the clean-up of environmental disasters as nanotechnology will allow us to remove oil and other (19)..... from the water far more.....(20). And, if nanotechnology progresses as expected – as a sort of building block set of about 90 atoms – then you could build anything you wanted from the bottom up. In terms of production, this means that you only use what you need and so there wouldn't be any(21)

The notion that you could create anything at all has major (22)..... for our health. It means that we'll eventually be able to (23)..... anything. This would have a phenomenal effect on our society. In time it could even lead to the eradication of

(24)..... through the introduction of machines that produce food to feed the hungry.

But it's in the area of medicine that nanotechnology may have its biggest impact. How we detect disease will change as tiny biosensors are developed to (25)..... tests in minutes rather than days. There's even speculation nano-robots could be used to slow the ageing process, lengthening life (26).....

As you can see, I'm very excited by the implications that could be available to us in the next few decades. Just how long it'll take, I honestly don't know.
