Distributive Property

The distributive property is a rule in math that lets us break apart a multiplication problem into smaller parts to make it easier to multiply.

Look at the example below.
we want to multiply 123 times 6. That's a big number and it will be difficult to do it just like that.

This is where the distributive property will help us.

123 x 6

First we can put 123 into an expanded form
