III. Read the text and choose the correct answer.

Astronauts work incredibly hard, putting in long hours in unnatural, difficult conditions. But sometimes they get pushed too hard, and reach a breaking point. This is the story of Skylab 4, the astronaut crew that **kicked off** the holidays with a mutiny.

The mission launched on November 16, 1973. The crew of Skylab 4-Gerald Carr, William Pogue and Edward Gibson - were all space-rookies at the start of their 84 days in orbit. Like their predecessors on Skylab, the bulk of their time was devoted to scientific experiments including observations of comet Kohutck and the first recording of the birth of a solar flare. But unlike previous crews, they fell behind schedule and got into quarrels with Mission Control.

The astronauts claimed NASA was demanding too much. NASA countered that the rookie crew should be working through meals and scheduled breaks to catch up. The astronauts requested time off; Ground Control was horrified and confused, citing the request for time off as signs of lethargy and depression.

Commander Carr attempted to reason with Mission Control, pointing out, “On the ground, I don’t think we would be expected to work a 16-hour day for 85 days, and so I really don’t see why we should even try to do it up here.” Meanwhile, Pogue tried to explain that by over-scheduling, NASA was setting the astronauts up for failure: “You have to put away equipment, you have to debrief, and then you have to move from one position to another, and you have to look and see what’s coming up, and we’re just being driven to the wall! There’s not enough consideration given for moving from one point in the spacecraft to another and allowing for transition for one experiment to another. When we oppressed bodily from one point in the spacecraft to another with no time for mental preparation, let alone getting the experiment ready, there’s no way we can do a professional job!”

Six weeks into the mission, **the crew broke**. They declared an unscheduled day off, turned off their radios, and took the day to shower, stare out the window, and relax. After the strike, Commander Carr renegotiated a work-schedule with Ground Control. The crew was to be left alone during meals, and no strenuous work would be scheduled after 8.p.m. Routine chores would be placed on the list for the astronauts to pick off at their convenience instead of on a rigid schedule. The truce had consequences: with more rest and higher moral; the astronauts were

more productive. But they also were no longer trusted, and once the mission ended, none of the trio ever flew again.

This wasn't the only space-mutiny: the crew of Apollo 7 went on strike after all three caught colds in orbit and a Mir crew refused to complete a sixth spacewalk inside of two months to complete nonessential repairs. Considering how independent astronauts are, how rough the space environment is, and how much bureaucrats want to squeeze out of every expensive mission, it's a wonder mutinies have been so rare.
