

How Birds Fly in the Sky

Let's Focus

Which body parts help birds fly?

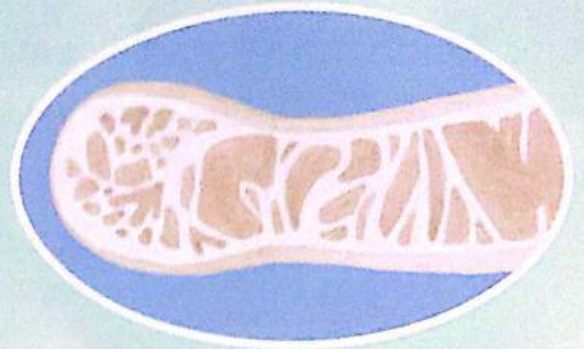

When people made the airplane, their model was birds. Birds are good at flying. How do they do it?

First, birds have two strong **wings**. They **flap** their wings hard to fly. This helps them **lift off** the ground.

Second, birds have special **bones**. Their bones are thin and **empty** inside. That makes birds very **light**.

Third, birds don't have teeth. They have beaks. Beaks are much lighter than mouths with teeth. So birds are light!

Don't you think that birds have perfect bodies for flying?
