

WILD LIFE

Wildlife is very important for the Earth. Wild animals live in different habitats such as forests, jungles, rain forests, deserts, grasslands and marshes. Some animals are warm-blooded, like mammals and birds, and some are cold-blooded, like reptiles.

Mammals are lions, tigers, cheetahs, elephants, horses, kangaroos, deer and camels. Carnivores hunt prey to survive and they eat meat. Herbivores eat the leaves of the trees, grass and plants.

An elephant has a long trunk and tusks. A camel has humps to survive in the desert.

Reptiles are snakes, lizards, turtles and crocodiles. Birds such as eagles, falcons, owls, storks and ostriches have wings and can fly, but ostriches cannot fly and they run very fast.

Sea animals like dolphins, whales and sharks can swim. They have fin and scales.

Unfortunately, many animals are endangered because people destroy habitats, make fields, pollute the environment and hunt animals. Humans should nature. People should show respect, take care of animals, vaccinate domestic animals and educate others. If we find a way to protect wildlife, animals can survive and the world will be a better place.

1-Match the words with definitions.

snake-desert-habitat-carnivore-elephant-herbivore
