

# Fractions

## SUBTRACTION

Practice subtracting fractions with the same denominators by joining and separating parts referring to the same whole.

Solve the following problems.

$$\frac{4}{9} - \frac{2}{9} = \frac{\square}{\square}$$

$$\frac{7}{11} - \frac{4}{11} = \frac{\square}{\square}$$

$$\frac{5}{8} - \frac{3}{8} = \frac{\square}{\square}$$

$$\frac{6}{10} - \frac{2}{10} = \frac{\square}{\square}$$

Circle the Right answer.

1.  $\frac{4}{6} - \frac{3}{6}$

$(\frac{1}{6}, \frac{7}{6})$

2.  $\frac{3}{4} - \frac{2}{4}$

$(\frac{1}{4}, \frac{1}{8})$

Fill in the blank:

- When we subtract fractions, we keep the \_\_\_\_\_ the same.
