THE SOIL IS CRYING: WHO WILL PROTECT OUR FUTURE?

In Gobernador Virasoro, Corrientes, soil pollution is a serious problem. Toxic waste and pesticides can damage the soil and crops. Exhaust fumes contribute to global warming and the greenhouse effect. Deforestation destroys the natural habitat of animals. In my opinion, we must protect our natural resources.

People have polluted the environment for many years. Acid rain and radiation can also cause damage. The ozone layer protects life on Earth, but pollution is a danger. If we continue to pollute the soil, future generations will face problems. Unless we change our habits, some areas may become heavily polluted and uninhabitable. A flood, drought, or forest fire can make life difficult. In the future, people may lose crops, injure animals, and suffer from starvation.

Sawmills and factories can also pollute the soil. They produce toxic waste, chemicals, oil and sawdust. If these materials enter the soil, they will damage plants, crops and animals. Some factories have polluted areas near our communities. This pollution can affect our health and natural resources. In my opinion, economic development is not more important than our health. We must ask ourselves: What kind of environment will we leave for future generations?
