

My Basic Physical Capacities

● We have four main capacities

Every activity we do requires a different capacity which is also appropriate for the exercise we are doing. In all the physical activities, sports or games we do, we always use these four main capacities.

- **Flexibility.** This keeps our joints and limbs flexible so that we can move without difficulty. We lose our flexibility as we grow older if we do not exercise regularly.
- **Speed.** Is the result of the impulses our body receives from our muscles and bones. This is how fast we can move in a space of time.
- **Strength.** Is the capacity that permits us to impulse our body, throw, catch and carry weight. Strength is an important sign of good health.
- **Stamina.** Is the capacity that permits us to resist strenuous efforts or keep up our speed for a long period of time.

Things to remember

- 1 **Very few people in the world are champions.**
We train to keep healthy.
- 2 **Professional sportsmen train long hours everyday and do not do any other kind of work.**
- 3 **Regular exercise and a healthy diet are the most important things in a healthy lifestyle.**

Warming up

● How we warm up

To make sure that our body does not go from a quiet relaxed state into a state of violent activity, we have to start exercising slowly and quicken up our movements little by little. Warming up helps our body to:

- Adapt itself mentally and physically to carry out a physical activity.
- Raise its temperature so that the blood circulates in our muscles and joints and avoids injuries.
- Feel happier and enjoy the physical activity we are doing.
- Make friends.
- Always start by exercising slowly, don't tire yourself. Stop to rest now and again and move your limbs without forcing your joints.
