

A Grand Old Canyon

What is a Canyon?

Canyons are deep valleys surrounded by rocky cliffs. They are formed by **erosion**. Rain and river water hit rocks and sand. Strong winds blow cliffs and water wears down the rocks. Canyons are not just found on land. They can be found on the ocean floor. These canyons were formed by strong ocean currents that wore away the rock.

The Grand Canyon

The Grand Canyon is one of the most famous canyons in the world. It is 277 miles long. It would take you about five hours to drive that many miles. The cliffs of the Grand Canyon are made of brown, red, and yellow rocks and sand. It is one mile from the top of the cliffs to the floor of the canyon. The Colorado River flows along the canyon floor.

Visiting the Canyon

The Grand Canyon is a national park. Over 5 million people visit it each year. Visitors enjoy hiking, camping, and white water rafting. Hiking in the canyon can be very dangerous. Many people become **dehydrated** from the high temperatures of 100° or more and not having enough water. Many people have also fallen off of high cliffs. About 600 people have died in the Grand Canyon in the last 150 years.

The pink rattlesnake startles hikers in the canyon as it suns itself on warm rocks along trails.

There are six species, or kinds, of rattlesnakes that live in the Grand Canyon. The most common is the Grand Canyon Pink Rattlesnake. Its **hue** matches the rocks found in the canyon.

The canyon can be dangerous but people from all over the world continue to visit and enjoy its beauty.

Canyons can be found all over the world. One of the biggest and most famous canyons is the Grand Canyon which is located in Arizona.
