1. If you live in Pennsylvania and are getting ready to vacation in California. How would you find out the weather in California?
 - a. Reading a barometer
 - b. Checking the hygrometer
 - c. Looking out your window
 - d. Looking at a weather map
2. The local meteorologist announces that the humidity today is at 95%. What does this mean?
 - a. The air pressure is very low
 - b. There is a chance of getting snow
 - c. There is a great deal of moisture in the air
 - d. The air is very dry
3. What does a hygrometer measure?
 - a. Temperature
 - b. Humidity
 - c. Pressure
 - d. Wind speeds
4. How does an anemometer work?
 - a. Small cups spin in the wind, and it measures how fast they go.
 - b. It determines how heavy the air is, and then it predicts storms.
 - c. Rain or snow falls onto it, and it measures how much there is.
 - d. It catches the wind and points in the direction the wind is blowing.
5. Which instrument measures air pressure?
 - a. Thermometer
 - b. Anemometer
 - c. Hygrometer
 - d. Barometer
6. Why does low air pressure usually indicate bad weather?
 - a. It puts people in low spirits
 - b. Storms form in low pressure
 - c. It means cold weather is coming
 - d. The humidity is always low
7. Why do scientists need to be careful where they place a rain gauge?
 - a. The rain gauge is a delicate instrument with many breakable parts all over it.
 - b. A rain gauge cannot be placed in an area that gets a lot of precipitation.
 - c. A rain gauge has sharp edges that can cut scientists' hands
 - d. If the gauge is blocked from rain, it won't accurately measure the amount of rain.
