

TRANSNATIONAL TEAMS FOR THE FINAL PRODUCT

AIR POLLUTION

(First Team : Elana GIGLIO – Esin BAŞARAN)

Air pollution is one of the main environment problems nowadays. Smokes and toxic dust from the industries, factories cause air pollution. Vehicles' exhaust gases also pollute the air. Factories are polluting the air but farms can also be a source of air pollution. It is very important to make people aware of this problem and its effects. Due to air pollution, millions of people get ill and many of them die. Children also suffer from bronchitis and asthma diseases because of air pollution. It also causes serious health problems like cancer. So we must plant more trees and use public transportation to reduce air pollution. Trees are necessary for oxygen but people cut down trees for different reasons like agriculture and furniture. A solution for air pollution may be using fewer cars which pollute the air.

- 1- Air pollution is a serious problem for us.
- 2- Many people die because of air pollution.
- 3- Cutting down trees has no effect on air pollution.
