

## TRANSNATIONAL TEAMS FOR THE FINAL PRODUCT

## WATER POLLUTION

(Second Team : Ilenia VITA – Esra Cenikli ASLAN )

Water pollution is a main problem for marine life because seas and oceans are home to various animals. We shouldn't dump waste into lakes and rivers to prevent water pollution. Agricultural activities and chemicals also pollute the water. We can filter wastes to prevent chemical contamination in water. We shouldn't throw garbage bags, plastic and similar wastes in water. Water pollution is not only caused by human activities but it may also be natural. Some of these natural causes are soil erosion, clay or silt runoff and leaching. Oils and petrol thrown in water can kill fish and harm sea birds a lot. Most of the plastic pollution in the ocean comes from fishing boats, tankers and cargo ships. We must prevent water pollution by taking some actions. We should stop global warming, reduce the use of chemicals on crops. We should stop throwing waste into water and restrict the use of plastic bags. We should also encourage sustainable fishing policies. The water is very important for our life on the Earth.

- 1- Agricultural activities never cause water pollution.  
.....
- 2- We shouldn't throw anything in water.  
.....
- 3- Oils in water kills not only fish but other animals too.  
.....
