We know that it is very cold on Mars. Scientists recorded the temperature of Mars in several places on the planet. They took these temperatures to discover the **average** temperature on Mars, which is minus 60 degrees Celsius. Because the temperature is so low, there is no **liquid** on Mars, only ice. Carbon dioxide (a gas) is **trapped** in this ice—it cannot get out. However, heat can melt the ice and turn it into water. This can **release** the carbon dioxide and let it into the atmosphere. When the **level** of carbon dioxide increases in the atmosphere, Mars will become warmer.
