

# CIRCLE

(type your answer)

$$\angle BAC = x^\circ$$

(match the reason)

$$\angle BPC = \boxed{\phantom{00}}^\circ$$

- Angle at the center = 2x angle at circumference

$$\angle BOC = \boxed{\phantom{00}}^\circ$$

- Angle in the semicircle

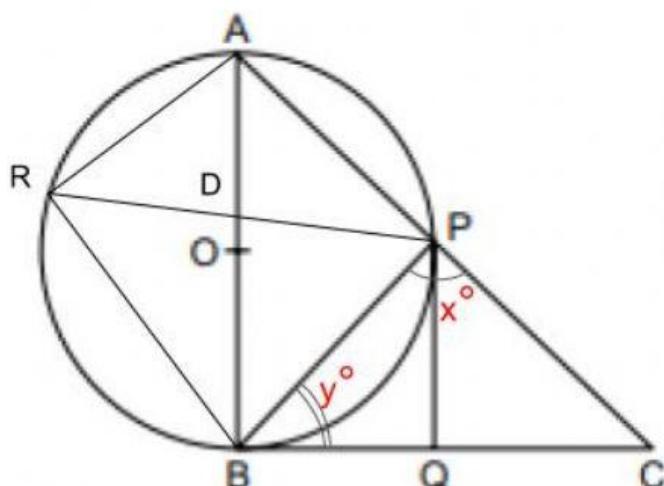

$$\angle BQC = \boxed{\phantom{00}}^\circ$$

- Angles in same segment

If PC is the diameter

Then  $\angle PBC = \boxed{\phantom{00}}^\circ$

- Opposite angles of cyclic quadrilateral are supplementary

Given a circle with center O.

Tangent QP and QB at points P and B respectively.

$$\angle PBQ = y^\circ, \angle BAC = x^\circ$$

(Drag and drop)

90°    x°    y°    CB    CP    BD    PD    QP    LU    LT    VU    TS

(Match the reason)

$$\angle BRP = \boxed{\phantom{00}}^\circ$$

- Angle between radius and tangent.

$$\angle ARB = \boxed{\phantom{00}}^\circ$$

- Angle between tangent and chord = Angle in alternate segment

$$\angle OBQ = \boxed{\phantom{00}}^\circ$$

- Exterior angle of cyclic quadrilateral = Interior opposite angle.

$$QB = \boxed{\phantom{00}}^\circ$$

- Tangents from common point.

$$\boxed{\phantom{00}}^2 = CA \times \boxed{\phantom{00}}$$

$$RD \times \boxed{\phantom{00}} = \boxed{\phantom{00}} \times AD$$

$$LS \times \boxed{\phantom{00}} = LV \times \boxed{\phantom{00}}$$
