

**Part A** Read the passage about global warming.

**Global Warming and Endangered Animals**

Scientists predict that global warming could lead to the extinction of a lot of animals in the near future.

Global warming can harm the ecosystems in which animals live. Endangered animals can be found all over the world - see the examples below.

 <p>Salmons</p>	 <p>Polar Bears</p>	 <p>Koalas</p>
<p>Loss of oxygen in sea-waters due to warming has created difficulties for them to breed.</p>	<p>As the climate warms, Arctic sea ice is melting. The polar bears' natural habitat is disappearing.</p>	<p>Koalas will lose a lot of habitat because of heat and droughts.</p>

What can we do now to stop global warming? Global warming cannot be stopped completely, but there are things we can do.

- Use less energy by turning off lights, TV's, and computers when they are not being used. Use the air conditioners less in the summer.
- Walk or ride a bicycle instead of using a car.
- Plant trees to absorb carbon dioxide and provide shade for buildings.
- Reduce, reuse and recycle whatever you can.

Together, we can help before it is too late.

Part B Create a poster about the endangered animals and global warming. Write the ways to help them.
