The line graph \_\_\_\_\_ how the vehicle preferences of British changed \_\_\_\_\_ the time by comparing the average distance an English travelled using different modes of carriers in 1985 and 2000. \_\_\_\_\_, cars were British citizen's primary mode of transportation and taxi was the least used mode of travel for them.

As the \_\_\_\_\_ suggests, an English travelled more than 6400 miles on an average in a year which was almost 36% higher than the distance an average Brit travelled in 1985. Car use \_\_\_\_\_ this total travel as more than 4800 miles out of 6400 in 2000 were crossed using automobiles and a similar \_\_\_\_\_ was seen in 1985. Use of personal cars in truth \_\_\_\_\_ over the time, as the data outlines. \_\_\_\_\_ on buses was higher than train and bicycle use and despite an average 255 miles walking by a Brit in 1985, it \_\_\_\_\_ after 15 years.

Taxi was perhaps the least \_\_\_\_\_ mode of commuting as only 13 miles were travelled by a British using it in 1985 which, despite an increase in 2000, was ignorable. Train travel \_\_\_\_\_ in 2000 while distance travelled by British in local buses \_\_\_\_\_. All other transportsations \_\_\_\_\_ to 585 miles of travel by a Brit in 2000, an \_\_\_\_\_ than that of 1985.
