

<del>nose</del>	trachea	carbon dioxide	alveoli
lungs	pharynx	mouth	oxygen
			bronchi

1. We breathe in through our nose and                     .
2. The                      opens and the air goes down a tube called the                     .
3. The trachea divides into two tubes called                     .
4. The air passes through the bronchi and enters the                     .
5. Inside the lungs, the bronchi divide into smaller tubes. At the end of these tubes, there are tiny sacs called                      which are covered in capillaries.
6. It is here that                      passes from our lungs into our blood and                      passes from our blood into our lungs.
