DATE: \_\_\_\_\_

## HOW DOES A SEED BECOME A PLANT?

All seeds are made of \_\_\_\_\_ parts. These three parts are called \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_. The seed coat goes around the \_\_\_\_\_ of the seed. It \_\_\_\_\_ the seed. The embryo is the tiny \_\_\_\_\_ plant inside of the seed. The endosperm is \_\_\_\_\_ inside of the seed. Seeds that are in your hand or in your food will not grow. They are \_\_\_\_\_. Another word for "sleeping" is \_\_\_\_\_.

All seeds need three things: \_\_\_\_\_, the right \_\_\_\_\_, and \_\_\_\_\_. When seeds begin to grow, this is called \_\_\_\_\_. The first part of the plant to come out of the seed is the \_\_\_\_\_. Roots always grow \_\_\_\_\_. After the root comes out going downward, a \_\_\_\_\_ comes out going \_\_\_\_\_. When a plant grows upward and out of the ground, we say it has \_\_\_\_\_. When plants get bigger and become adults, they make \_\_\_\_\_ of their own.
