- ① Fish ② Bird ③ Reptiles ④ Amphibian

II) Choose the correct classification for each animal:

III) Choose the correct option for each animal:

Characteristic	Mammals	Amphibians	Reptiles	Birds	Fish
Reproduction					
Skin					
Breathe					
General habitat					
Blood					

IV) Read the following text and answer True or False:

Insects are a type of invertebrate, an animal that does not have a backbone. They hatch as egg and grow into adults. Adult insects are hard on the outside and are divided into three sections: head, thorax, and abdomen. An insect's eyes and antennae are on its head. They have six legs and two sets of wings on the thorax. To breathe, instead of lungs, insects breathe with a network of tiny tubes called tracheae. There are over a billion types of insects living in the world.

- Insects have live babies. _____
- Insects body is divided in three parts. _____
- Insects have eight legs. _____
- Insects breathe through tracheae. _____
- There are over one billion type of insects. _____
