

Digestive System

Drag and drop the steps of digestion

Teeth crush the food into small pieces and saliva softens the food

The food goes down the OESOPHAGUS and enters the stomach

The STOMACH mixes the food with gastric juices and after 3 or 4 hours, the food passes into the small intestine

The SMALL INTESTINE absorbs nutrients: vitamins, proteins...

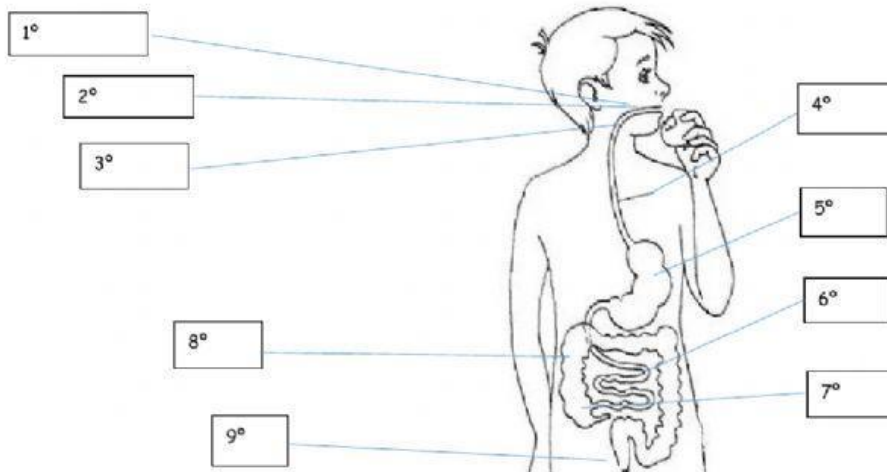

Digestion starts in the MOUTH

The LARGE INTESTINE absorbs water and minerals and stores the faeces

The tongue pushes the food into the oesophagus

The food that was not absorbed goes to the large intestine

Finally, the faeces exit the body through the ANUS
