

Powers and Exponents

Exponents are also called **Powers** or **Indices**

The exponent of a number says **how many times** to use the number in a **multiplication**.

In this example: $8^2 = 8 \times 8 = 64$

In words: 8^2 could be called "8 to the second power", "8 to the power 2" or simply "8 squared"

So an Exponent saves us writing out lots of multiplies!

Example: a^7

$a^7 = a \times a \times a \times a \times a \times a \times a = aaaaaaa$

Example: $10 \times 10 \times 10 = 1,000$

Each 10 is a **factor**

1,000 is the **product**.

1,000 is a **power** of 10.

You can use an exponent to tell how many times 10 is used as a factor.

10^3 exponent = $10 \times 10 \times 10 = 1,000$

Read 10^3 as ten to the third power.

Look for a pattern in the chart. Compare the number of zeros in the number with the exponent in the exponent form.

Number	Factor Form	Exponent Form	Read
100	10×10	10^2	ten to the second power or ten squared
1,000	$10 \times 10 \times 10$	10^3	ten to the third power or ten cubed
10,000	$10 \times 10 \times 10 \times 10$	10^4	ten to the fourth power
