Name: _____

Digestive system

Section A: Answer all the questions below.

1. Where does our body get all its energy from?

_____

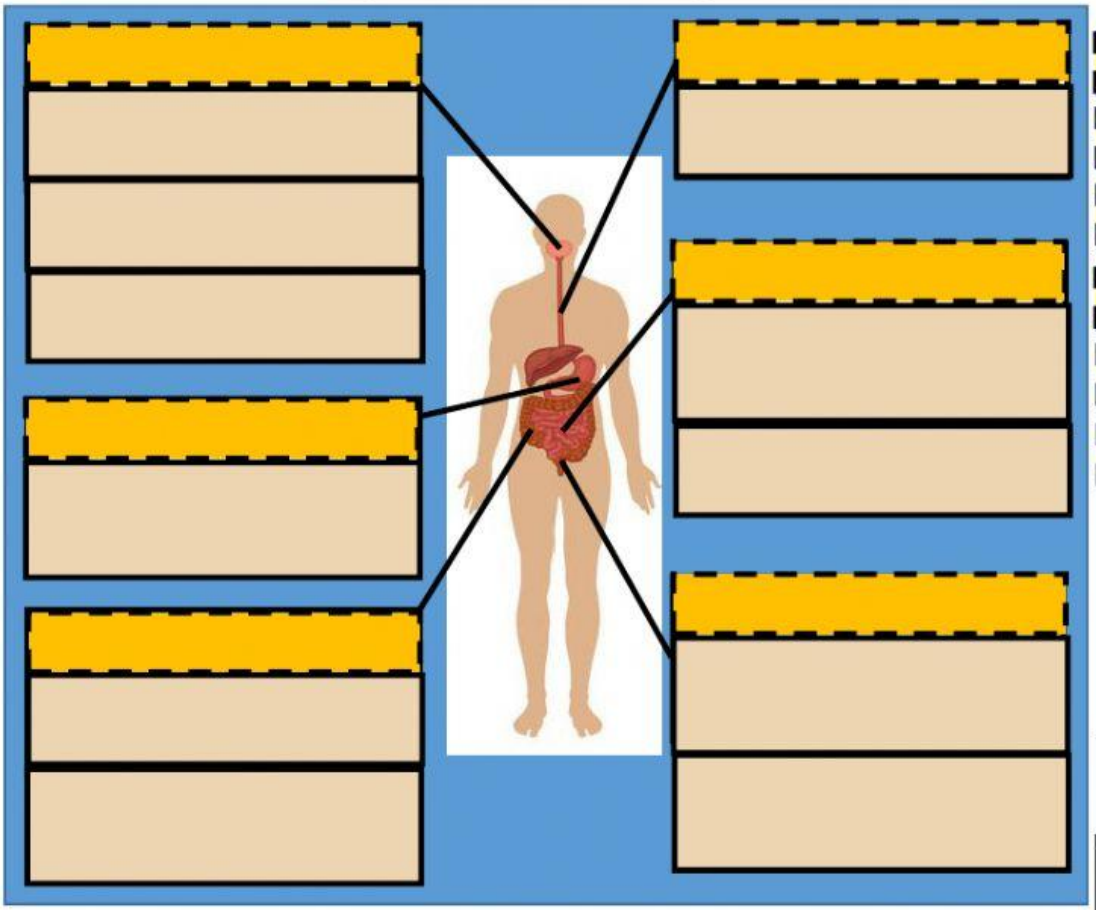

2. What is the name of the process where food is broken down and absorbed into the blood?

_____

3. What is the primary function of the digestive system?

_____

Section B: Drag the statements or names of organs into the correct boxes.

gullet

small intestine

stomach

large intestine

rectum

mouth

The tongue helps to push the food into the gullet.

Any food that cannot be digested goes into the large intestine.

Digestive juices in the stomach further break down the food into a soupy liquid.

The undigested food moves from the large intestine to the rectum and is stored as waste.

The waste gets passed out through the opening called the anus.

Digestion is completed in the small intestine

Teeth in the mouth cut and grind food into small pieces.

More digestive juices further break down food into substances which the body can absorb.

A digestive juice called saliva also breaks down food.

The large intestine removes most of the water from the undigested food.

Muscles in the wall of the gullet push the food into the stomach.
