

Listen and read the text....

Bones are strong and hard. Most of the parts of our body are soft. Bones hold our body up. There are 206 bones in our body. When our bones are put together, they are called a skeleton.

Our bones are hard but they can break. If a bone breaks, it can grow together again. The longest bone in our body is the thigh bone. The smallest bone in our body is in the ear. The parts of the body with the most bones are the wrist, hand and fingers. There are 54 bones here.

Our skeleton helps us move around easily. We can walk, run, bend, jump and many more actions because we have a skeleton. Our skeleton also protects the inside of our body.

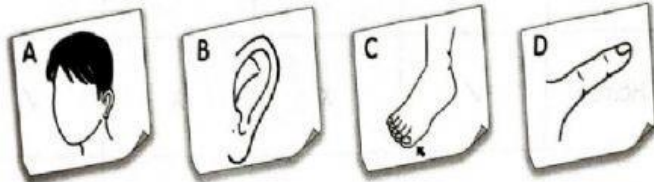

1. How many bones are there in the body?

- A 54
- B 154
- C 206
- D 254

2. When our bones are _____, they are called a skeleton.

- A put together
- B inside our body
- C strong and hard
- D able to move around

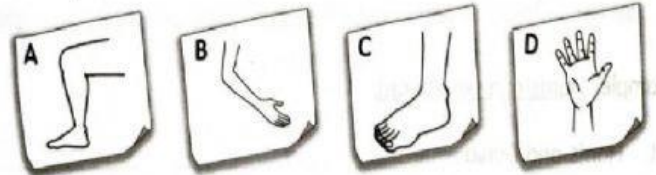

3. Which part of the body has the smallest bone?

Choose the correct answers.

4. Which part of the body has the longest bone?

5. Guess which bones help you run.
