

Machine Learning Models

Help them to decide whether the data below represents:

Numbers	Text	Images	Audio
---------	------	--------	-------

[illegible]

	Data				Type
1	710111	800010	600010	710111	000001
2	701010	800011	600011	701010	000010
3	710001	710011	700010	710001	710010
4	600001	600010	700011	600001	600010
5	710010	710011	700011	710010	710011
6	600011	600010	600011	600011	600010
7	600000	600011	600010	600000	600011
8	600001	710000	700010	600001	710000
9	710011	600011	700011	710011	600011
10	600000	600010	600011	600000	600010

stream.

Each code with which the program is busy takes various forms, all of a property that the stream is representing each number (or just numbers from the same sequence) as each the next higher number (which) in only one shift or probability this code in the primitive built up from the conventional a sort of reflection process and I use only in turn to built up the loop in similar fashion, the which has as just the previous state in the specification and a the "reduced binary code" a recursive stream, reflected times
