

Green Flying Tree Frog

Green Flying Tree Frog can grow up to 10cm long. It is green and yellow. It has big webbed hands and feet. It lives in the trees. It eats bugs. This frog stays up in the trees and only comes down to lay its eggs in forest ponds.

It can fly from tree to tree. The webs on its hands and feet help it to fly. It can camouflage with the leaves of the trees because of its colour. This frog is endangered. There are a small number of these frogs living in Borneo. Dirty forest ponds and cutting down trees could hurt this frog.

1. How long can the green flying tree frog grow? a) 10cm b) 100cm c) 10mm	6. What does this frog eat? a) bugs b) insects c) other frogs
2. What colour is this frog? a) green and brown b) yellow and brown c) green and yellow	7. Why does it come down from the trees? a) to look for food b) to lay its eggs c) to sleep
3. What size are its hands? a) small b) big c) short	8. Where does it lay its eggs? a) in the trees b) on the forest floor c) in forest ponds
4. What size are its feet? a) big b) small c) short	9. What helps the green flying tree frog fly? a) its webbed feet b) the colour of its skin c) its habitat
5. Where does the green flying tree frog live? a) in the trees b) in forest ponds c) on the forest floor	10. What could hurt this frog? a) loss of its habitat and water pollution b) water pollution and its webbed feet c) loss of its habitat and the colour of its skin
