Text for question 15-17!

Once of the most valuable and widespread plants is bamboo. It is a tall tree like grass. There are more than 350 species. Most grow in Asia and on islands of the Indian and Pacific oceans. Although bamboo is a tropical plant, it can also grow in cooler temperate zones.

A single root may produce as many as 100 stems. They are hollow, woody, and jointed. The stems are approximately 3 feet, (0.9 meter) around. Sprouts grow fast, at times 1 foot (0.3 meter) or more a day. They may grow to 30, 50 or even 130 feet (9 to 40 meters) in height. Near the top are many branches, Some species do not bloom for 60 years or more.

Bamboo products range from food to houses. Asian people usually use the sprouts as vegetables. In east and Southeast Asia, people use the hollow stems as water pipes, or for building bridges and houses. Short sections serve as pails and cooking utensils. The stems are used for walls, floors and roofs. Thinner strips are woven into mats, chairs, cages, and curtains. Bamboo fishing rods are made of matched strips glued together. Split bamboo is also used for chopsticks and fan ribs. The inner parts of the stems of several are made into quality paper.

15. Which part of the bamboo can be used for building houses?
