

## ARITHMETIC PROGRESSIONS

1. What's the difference in an arithmetic progression with first term is 1 and the third term is -17.

$$= + \cdot d$$

$$d =$$

2. What's the difference of an arithmetic progression where 5th term is -60 and 11th term is 60

$$= + \cdot d$$

$$d =$$

3. Write down the general term of an arithmetic progression with 1st term -1 is and the difference is 4.

$$a_n = + (n - 1) \cdot$$

$$a_n =$$

4. Which is the position of 87 in the previous progression.

$$87 =$$

$$n =$$

5. Find out the sum of the first 20 terms of an arithmetic progression with general term  $a_n = 3n + 5$

$$S = \frac{(\quad + \quad) \cdot \quad}{}$$

$$S =$$
