Question 26: A. radio B. television C. communication D. network

Read the following passage and write the letter A, B, C, or D on your answer sheet to indicate the correct answer to each of the questions.

How can scientists predict earthquakes? Earthquakes are not scattered anywhere but happen in certain areas. They happen in places where pieces of the earth's surface meet. For example, earthquakes often occur on the west-coast of North and South America, around the Mediterranean Sea, and along the Pacific coast of Asia.

Another way to predict earthquakes is to look for changes in the earth's surface, like a sudden drop of water level in the ground. Some people say animals can predict earthquakes. Before earthquakes people have seen chickens sitting in trees, fish jumping out of the water, snake leaving their holes and other animals acting strangely.

After an earthquake happens, people can die from lack of food, water and medical supplies. The amount of destruction caused by an earthquake depend on types of building, soil conditions and population. Of the 6000 earthquakes on the earth each year, only about fifteen cause great damage and many deaths.

Question 27: Earthquakes happen in certain areas where _____.

- A. pieces of the earth's surface meet B. many buildings are built
C. the population is large D. the soil conditions are stable

Question 28: Earthquakes often happen along _____.
