

Listen again and complete the notes.

Roughly \_\_\_\_\_<sup>1</sup> of all the food produced for consumption is thrown away every year. This is \_\_\_\_\_<sup>2</sup> dollars' worth of food, which could feed \_\_\_\_\_<sup>3</sup>. It is the equivalent of the entire country of China, which is \_\_\_\_\_<sup>4</sup> acres, being used to grow food which is then thrown away. In addition, the water required to grow this much food is equal to \_\_\_\_\_<sup>5</sup> people using \_\_\_\_\_<sup>6</sup>, per person, per day. There will not be this many people on the planet until around 2050, by which time we will need to have increased food production by \_\_\_\_\_<sup>7</sup>. Currently, around 700 million people go hungry. A lot of the waste is caused by high supermarket standards for appearance. For example, around \_\_\_\_\_<sup>8</sup> of European fish is discarded for this reason.
