

OPERACIONES COMBINADAS

Pasos para realizar operaciones combinadas:

1. Resuelve los paréntesis.
 2. Luego resolvemos las multiplicaciones y divisiones.
 3. Por últimos sumas y restas.
-

$$(15 \times 3) + (28 : 7)$$

Diagram illustrating the order of operations for the expression $(15 \times 3) + (28 : 7)$. The first step shows the multiplication 15×3 and the division $28 : 7$. The second step shows the results of these operations being added together.

$$(6 \times 7) - (15 : 3)$$

Diagram illustrating the order of operations for the expression $(6 \times 7) - (15 : 3)$. The first step shows the multiplication 6×7 and the division $15 : 3$. The second step shows the result of the multiplication being subtracted from the result of the division.

$$(9 \times 7) + (4 \times 9)$$

Diagram illustrating the order of operations for the expression $(9 \times 7) + (4 \times 9)$. The first step shows the multiplication 9×7 and the multiplication 4×9 . The second step shows the results of these multiplications being added together.

$$(7 \times 7) - 15$$

Diagram illustrating the order of operations for the expression $(7 \times 7) - 15$. The first step shows the multiplication 7×7 . The second step shows the result of this multiplication being subtracted from 15.

$$10 - (6 \times 5) + 35$$

Diagram illustrating the order of operations for the expression $10 - (6 \times 5) + 35$. The first step shows the multiplication 6×5 . The second step shows the result of this multiplication being subtracted from 10, and then the result being added to 35.

$$(10 \times 4) - (5 \times 5)$$

Diagram illustrating the order of operations for the expression $(10 \times 4) - (5 \times 5)$. The first step shows the multiplication 10×4 and the multiplication 5×5 . The second step shows the result of the first multiplication being subtracted from the result of the second multiplication.
