

## REPRODUCTION

### MALE AND FEMALE REPRODUCTIVE SYSTEMS

#### General information

- Reproduction is the \_\_\_\_\_ of new life.
- **Male** reproductive system: Its function is to produce \_\_\_\_\_ (sex cells). Some of its organs are \_\_\_\_\_ (you can see them) and others are \_\_\_\_\_ (you can't see them). Its main organs are the \_\_\_\_\_ and \_\_\_\_\_.
- **Female** reproductive system: Its functions are to produce \_\_\_\_\_ (sex cells), and to help create and carry new \_\_\_\_\_.

#### Male reproductive system

1. The \_\_\_\_\_: They produce \_\_\_\_\_ (the male hormone) and make sex cells, called \_\_\_\_\_.
2. When the sperm are mature, they pass into the \_\_\_\_\_.
3. When the sperm reach the \_\_\_\_\_, a liquid is released which mixes with the sperm to form \_\_\_\_\_.
4. The \_\_\_\_\_ provides substances which protect and give nutrients to the \_\_\_\_\_.

5. The semen enters the \_\_\_\_\_, inside the \_\_\_\_\_. The function of the penis is to allow the sperm to leave the man's body, in a process called \_\_\_\_\_.

6. The \_\_\_\_\_ is a layer of \_\_\_\_\_ which protects and holds the testicles. It helps regulate their \_\_\_\_\_.

### Female reproductive system

1. The \_\_\_\_\_ contain the female sex cells, called \_\_\_\_\_. One mature ovum is usually released each \_\_\_\_\_ from puberty until a woman reaches approximately her 50s.

2. The ovary releases the mature \_\_\_\_\_ into one of the two \_\_\_\_\_. \_\_\_\_\_ occurs in the tube if the woman's ovum is joined by a man's sperm.

3. Embryos develop in a muscular organ called the \_\_\_\_\_ or womb.

4. The \_\_\_\_\_ connects the uterus with the \_\_\_\_\_. Babies pass through the vagina to the outside world at \_\_\_\_\_.

5. The \_\_\_\_\_ covers the opening to the vagina.
