

The \_\_\_\_\_ system involves the \_\_\_\_\_ and \_\_\_\_\_ and how they work together to keep us alive. The heart is the size of your \_\_\_\_\_ and supplies our body with \_\_\_\_\_ gallons of blood. The 3 different \_\_\_\_\_ have specific functions in the body. The \_\_\_\_\_ are the smallest blood vessels.

The \_\_\_\_\_ carry blood away from the heart, while the \_\_\_\_\_ carry blood to the heart. \_\_\_\_\_ blood is a bright red in color and rich in \_\_\_\_\_ that is pumped through the \_\_\_\_\_ to the body.

\_\_\_\_\_ blood is \_\_\_\_\_ in color and lacks oxygen as it travels back to the lungs to pick up oxygen.

There are \_\_\_\_\_ main chambers in the heart, the upper chambers are called \_\_\_\_\_ and \_\_\_\_\_ the blood. The lower chambers are called \_\_\_\_\_ and they \_\_\_\_\_ the blood to the body.
